Learning Models (Calculus)

Multiple simulations of
different positions via
e.g. Reinforcement
Learning

+

Analytical approach
as a base for the
simulation

User end Devices

Phones/Tablets

AR Glasses

Rough Idea

- Get 3D map of land using drone (Tracks goal hole and align)
- Using Reinforcement Learning, find optimal path from starting
- Show the path over phone/AR

Questions

1. How do drones capture and analyze videos of golf balls during play to improve understanding of a golf course conditions?
2. In what ways do AR glasses provide live information to golfers, and how does this technology enhance their performance?
3. What specific data is required to monitor golf ball movements and course conditions effectively?
4. How are mathematical formulas applied to the data gathered from golf play to predict ball behavior and improve shot accuracy?
5. Can you explain how the learning and adaptation processes work within these technologies to enhance the information provided to golfers?
6. What are the advantages and disadvantages of using real-time and pre-collected data during a golf game?

Thank you
