

① why are we using drone?
is data available or are we collect it?

→ we assume there is no data with help of drone, we will visualize the field.

→ efficient way

1. reduce area we need to scan →
2. search for efficient way we can visualize the surface (not shown to user) e.g.
heat map or 3D visualization

② learning models (curriculum)

our approach

analytical + ML part

simulation of the ball =
"velocity,
"mass friction,
initial position,
final position"

to reduce error
"deep learning or reinforcement learning"

③ Visualization

how to visualize to player?

- use phone/tablets or AR
- hardware independent applications "application or browser."
